

FINAL PRE-PUSH FIX

FOREX ENGINE PRO

STATUS: READY_FOR_PUSH

18 sierpnia 2026

Deadlock confirmed and fixed with a Knowledge-bootstrap baseline collection path. Publish/deploy was not executed.

Knowledge unavailable -> Capital Gate ABSTAIN
-> unchanged Live baseline may collect real outcome
-> Capital Gate never becomes ALLOW

FOREX ENGINE PRO - Final Pre-Push Fix

Deadlock verdict

Deadlock existed.

The Live Bot already produced `signal_detected` and Shadow/Selected telemetry, but the only path to a broker-confirmed `trade_open` passed through `cooperativeEntry()`. With only one real resolved outcome, Knowledge was unavailable; Capital Gate returned ABSTAIN; the existing Live entry branch returned before `placeTrade()`. Therefore no new real outcomes could be created.

Minimal fix

The bootstrap path now recognizes exactly one case:

```
capitalGateDecision = ABSTAIN
capitalGateReason    = knowledge_evidence_unavailable
```

In that case only, the already-approved Live strategy may continue to its existing execution code to collect a real outcome. This is explicitly baseline collection, not a controlled ALLOW:

- Capital Gate remains ABSTAIN.
- No Shadow or Selected output authorizes the trade.
- BLOCK still stops execution.
- Timeout, service failure, malformed data, conflict, low confidence and every other ABSTAIN still stop execution.
- Existing Live filters have already passed before this branch.
- Existing risk, sizing, lot size, SL/TP, trailing, break-even and `placeTrade()` are unchanged.
- A `controlled_baseline_collection` telemetry event records the exception with `shadowInfluence=false`, `authority=live_bot`, and the same `signalId`.

No Knowledge threshold was reduced. `testSimulation` rows are not used as real outcomes.

Files changed

1. telemetry/managers/CooperativeManager.js

- Added the exact-reason helper `canCollectLiveBaseline`.
- It returns true only for Knowledge-bootstrap ABSTAIN.

2. index.js

- Applied the helper symmetrically to BUY and SELL.
- Added explicit baseline-collection telemetry.
- Did not modify `placeTrade()`, risk calculations or execution parameters.

3. telemetry/tests/unit/cooperativeManager.test.js

- Added the minimal regression test for bootstrap collection and rejection of unsafe reasons.

Tests

- Unit suite: 302/302 PASS
- Non-Knowledge integration suite: PASS

- Knowledge migration/manager/recovery/feature-flag/pattern tests: PASS
- Memory Integration, isolated: PASS
- Simulation suite: PASS
- Stress suite: 48/48 PASS
- Final targeted Shadow/Selected/Capital Gate tests: 16/16 PASS
- JavaScript syntax checks: PASS
- git diff --check: PASS

The shared PostgreSQL Knowledge and Memory fixtures were run in isolated processes to avoid false failures caused by concurrent fixture writes.

Live and risk invariants

Confirmed unchanged:

- RISK_PERCENT and calculateUnits().
- MAX_OPEN_TRADES and existing daily/open-trade limits.
- Stop-loss and take-profit calculations.
- placeTrade(symbol, side, units, slPips, tpPips) signature and calls.
- Existing Live filters and broker ownership.
- Shadow A/B/C/M, Selected and Knowledge remain unable to make broker calls.

Runtime and OANDA status

After restart:

- Telemetry Dashboard: running.
- API Server: running.
- Mockup Sandbox: running.
- Knowledge build: successful.
- Selected build: successful with lastError=null.
- Shadow M: restored in OBSERVE mode.
- OANDA remains unavailable locally: HTTP 401 Insufficient authorization for candle requests.

The code is ready to collect real data once OANDA authorization is repaired. No deployment or publish was performed.

Recommendation

PUSH the code change. Before expecting new real outcomes, repair the OANDA account/API authorization and verify the first controlled_baseline_collection, broker-confirmed trade_open, and subsequent outcome all retain the same signalId.
